### General information

Self-heating interrelated to speed, protection, attachment method and ambient conditions as well electronics and supply voltage must be considered for precise thermal dimensioning. Self-heating is supposed to approximate 12 K (IP 67 protection) per 1000 rpm. Operating the encoder close to the maximum limits requires measuring the real prevailing temperature at the encoder flange. For the current output (version C4), a load  $>470\ \Omega$  must be selected when supplied with 24 VDC in order to minimize the self-heating of the encoder and not to exceed the maximum operating temperature. For cable lengths  $>2\text{ m}$ , a current output (version C4) is to be preferred due to the voltage drop in order to avoid effects on the accuracy.

### Teach process

**Activate teach process**

Start teach process within 5 minutes after power on. Set teach input for >5 seconds on HIGH and afterwards on LOW level.  
DV/Status output: Oscillates after 5 seconds.

**Position 1**

Get encoder on position intended for min. voltage output / current output.  
Set teach input for >0.1 seconds on HIGH.  
DV/Status output: Switches to HIGH level for 3 seconds and flashes shortly.

**Position 2**

Get encoder on position intended for max. voltage output / current output.  
Set teach input for >0.1 seconds on HIGH.  
DV/Status output: Switches to HIGH level for 3 seconds and flashes shortly. If measuring range is exceeded or the limits are too close to each other, the teaching process was not successful and has to be repeated.

**Default**

Set teach input for >15 seconds on HIGH.  
DV/Status output: Oscillates after 5 seconds.
